

# WE WILL RECYCLE EVERY PART OF YOUR PLASTIC BOTTLES!

The main part of a plastic bottle, which is the body, is usually made of polyethylene terephthalate . This type of plastic is easy to recycle because it can be melted down and used to make new bottles and other plastic products.

The lid or cap of the bottle is also made of plastic, but usually of a different kind, such as high-density polyethylene  or polypropylene , which are also in high demand for recycling.

Recycling each part of the bottle ensures that all its materials are reused instead of being sent to a landfill.

**So, the next time you finish a plastic bottle, be sure to recycle all its parts!**

**You can take the lids off your plastic bottles and bring them to your local redemption centre along with all your recyclable beverage containers, or you can leave the lids on.**

If leaving lids on, for the safety of employees at redemption centres and processing plants, these steps must be followed:

- 1 - Empty bottle
- 2 - Crush bottle to remove air
- 3 - Put lid back on

Ensure that the label on your bottle remains intact and is not removed.
